1. Let U be a Gödel Universal function, and let $S=\{n: U_n \text{ is a surjective function}\}$. Is S enumerable? Is $\mathbb{N}\setminus S$ enumerable?

2. Let U be a Universal Gödel function. Let $H=\{(n,x)\in\mathbb{N}^2: U(n,x) \text{ terminates}\}$. Show that $H\in\Sigma_1$ and that $A\leq_m H$ for any $A\in\Sigma_1$.

3. Show that there is a number $r \in \mathbb{R}$ such that $\{q \in \mathbb{Q} \ : \ q < r\}$ is not enumerable.

4. Let A be an algorithm computing Gödel universal function. We say that the running time of A at n is polynomial iff there is an integer k such that A(n,x) terminates after $k + \log^k(x)$ steps.

Show that the set

 $\{n : \text{ the running time of } A \text{ at } n \text{ is polynomial}\}$

is undedicable.
